

SAPIENTIA AI — TOOLBOX TALK / SAFETY BRIEFING

Construction Site Safety Briefing · Field Distribution Copy

DATE	2026-06-25	TRADE	MEP
INCIDENT TYPE	Electrical	SEVERITY	Lost Time
FACILITATOR	_____	DURATION	~10 min
PROJECT	—	WORD COUNT	404

1 · OPENING SAFETY STATISTIC

Electrical hazards contribute to a significant share of construction fatalities; even low-voltage contact can cause cardiac arrhythmia or secondary falls.

2 · INCIDENT SCENARIO

On a recent mep project, the crew was working with mechanical, electrical, and plumbing rough-in with energized systems and overhead work. During a routine task, conditions aligned for a electrical event. A worker sustained an injury requiring days away from work or restricted duty, stopping production on that crew. The foreman stopped work immediately, secured the area, and walked the crew through what went wrong.

Before the event, the team had skipped a full pre-task briefing because the scope looked small. Materials were staged in a travel path, communication between trades was informal, and at least one worker assumed existing controls would be enough. That combination — hurry, assumptions, and unclear roles — is how serious events start on jobs that otherwise have good safety paperwork.

In this scenario, the trigger was familiar: production pressure, a last-minute schedule change, and nobody willing to call a timeout. After the event, the crew documented lessons learned, updated the JHA, and agreed on five field behaviors we will practice starting today. Nobody should need luck to go home safe. Your signature at the end of this talk confirms you understand the scenario and will apply these controls before the next pour, pick, tie-in, or excavation.

For MEP work specifically, focus on the interfaces: where your task meets equipment, weather, adjacent trades, and changing site layout. When those interfaces shift, stop and re-brief. A lost time outcome is a signal — either we got lucky or our controls partially worked. Either way, we tighten the plan before repeating the same task tomorrow. Discuss with your crew: What would you do differently in the first 30 seconds? Who has authority to stop work? Where are the nearest phones, eyewash stations, and muster points? Take two minutes now to point them out.

3 · CORRECTIVE BEHAVIORS

Apply these five field behaviors before repeating similar work:

#	Behavior / Control
1	Verify zero energy with a meter before touching conductors; follow LOTO every time.
2	Use GFCI protection on temporary power and inspect cords for damage daily.
3	Maintain approach boundaries around energized parts; only qualified workers inside.
4	Label panels and circuits; coordinate outages with all affected crews.

5	Wear appropriate arc-rated PPE for the incident energy level when required.
---	---

4 · ATTENDANCE SIGN-OFF

I acknowledge participation in today's toolbox talk and understand the hazards discussed.
